Project Title: QuickHire – Your First Job Portal

The Goal

Your task is to build **QuickHire**, a simple, fast, and clean website using **React.js** where students can find work in just three clicks.

The Challenge

You need to create a **Single Page Application (SPA)**. This means the website should feel like a mobile app—fast and smooth—without the screen "blinking" or reloading when you click a link.

What you need to build (The 3 Pages)

1. **The Welcome Page (Home):**
   - A big, friendly heading: "Find Your Dream Job Today."
   - A search box where users can type a job title (like "Designer" or "Developer").
   - A "Browse All Jobs" button to take them to the next page.
2. **The Job List Page:**
   - A list of job "cards." Each card shows the Company Name, Job Title, and Salary.
   - **Filter Buttons:** Allow users to click "Remote" or "Full-Time" to see only those specific jobs.
3. **The Job Details Page:**
   - When a user clicks on a job, show the full description.
   - Add an **"Apply Now"** button that shows a "Success!" message when clicked.

Skills You Will Practice

- **React Components:** Breaking a website into small, reusable pieces (like Buttons and Cards).
- **React Router:** Learning how to move between pages (`/home` to `/jobs`).
- **State Management:** Making the search bar and filters actually work.
- **Handling Data:** Using a list of jobs (stored in a JSON file) to fill your website with content.

Why this project?

By completing this, you will prove that you understand how a real-world web application works. It's a perfect "Minor Project" to show off on your LinkedIn or GitHub because it solves a real problem: **making job hunting simple.**
